

FLY TO THE FORECAST

Improving the Accuracy of Digital Elevation Model (DEM)

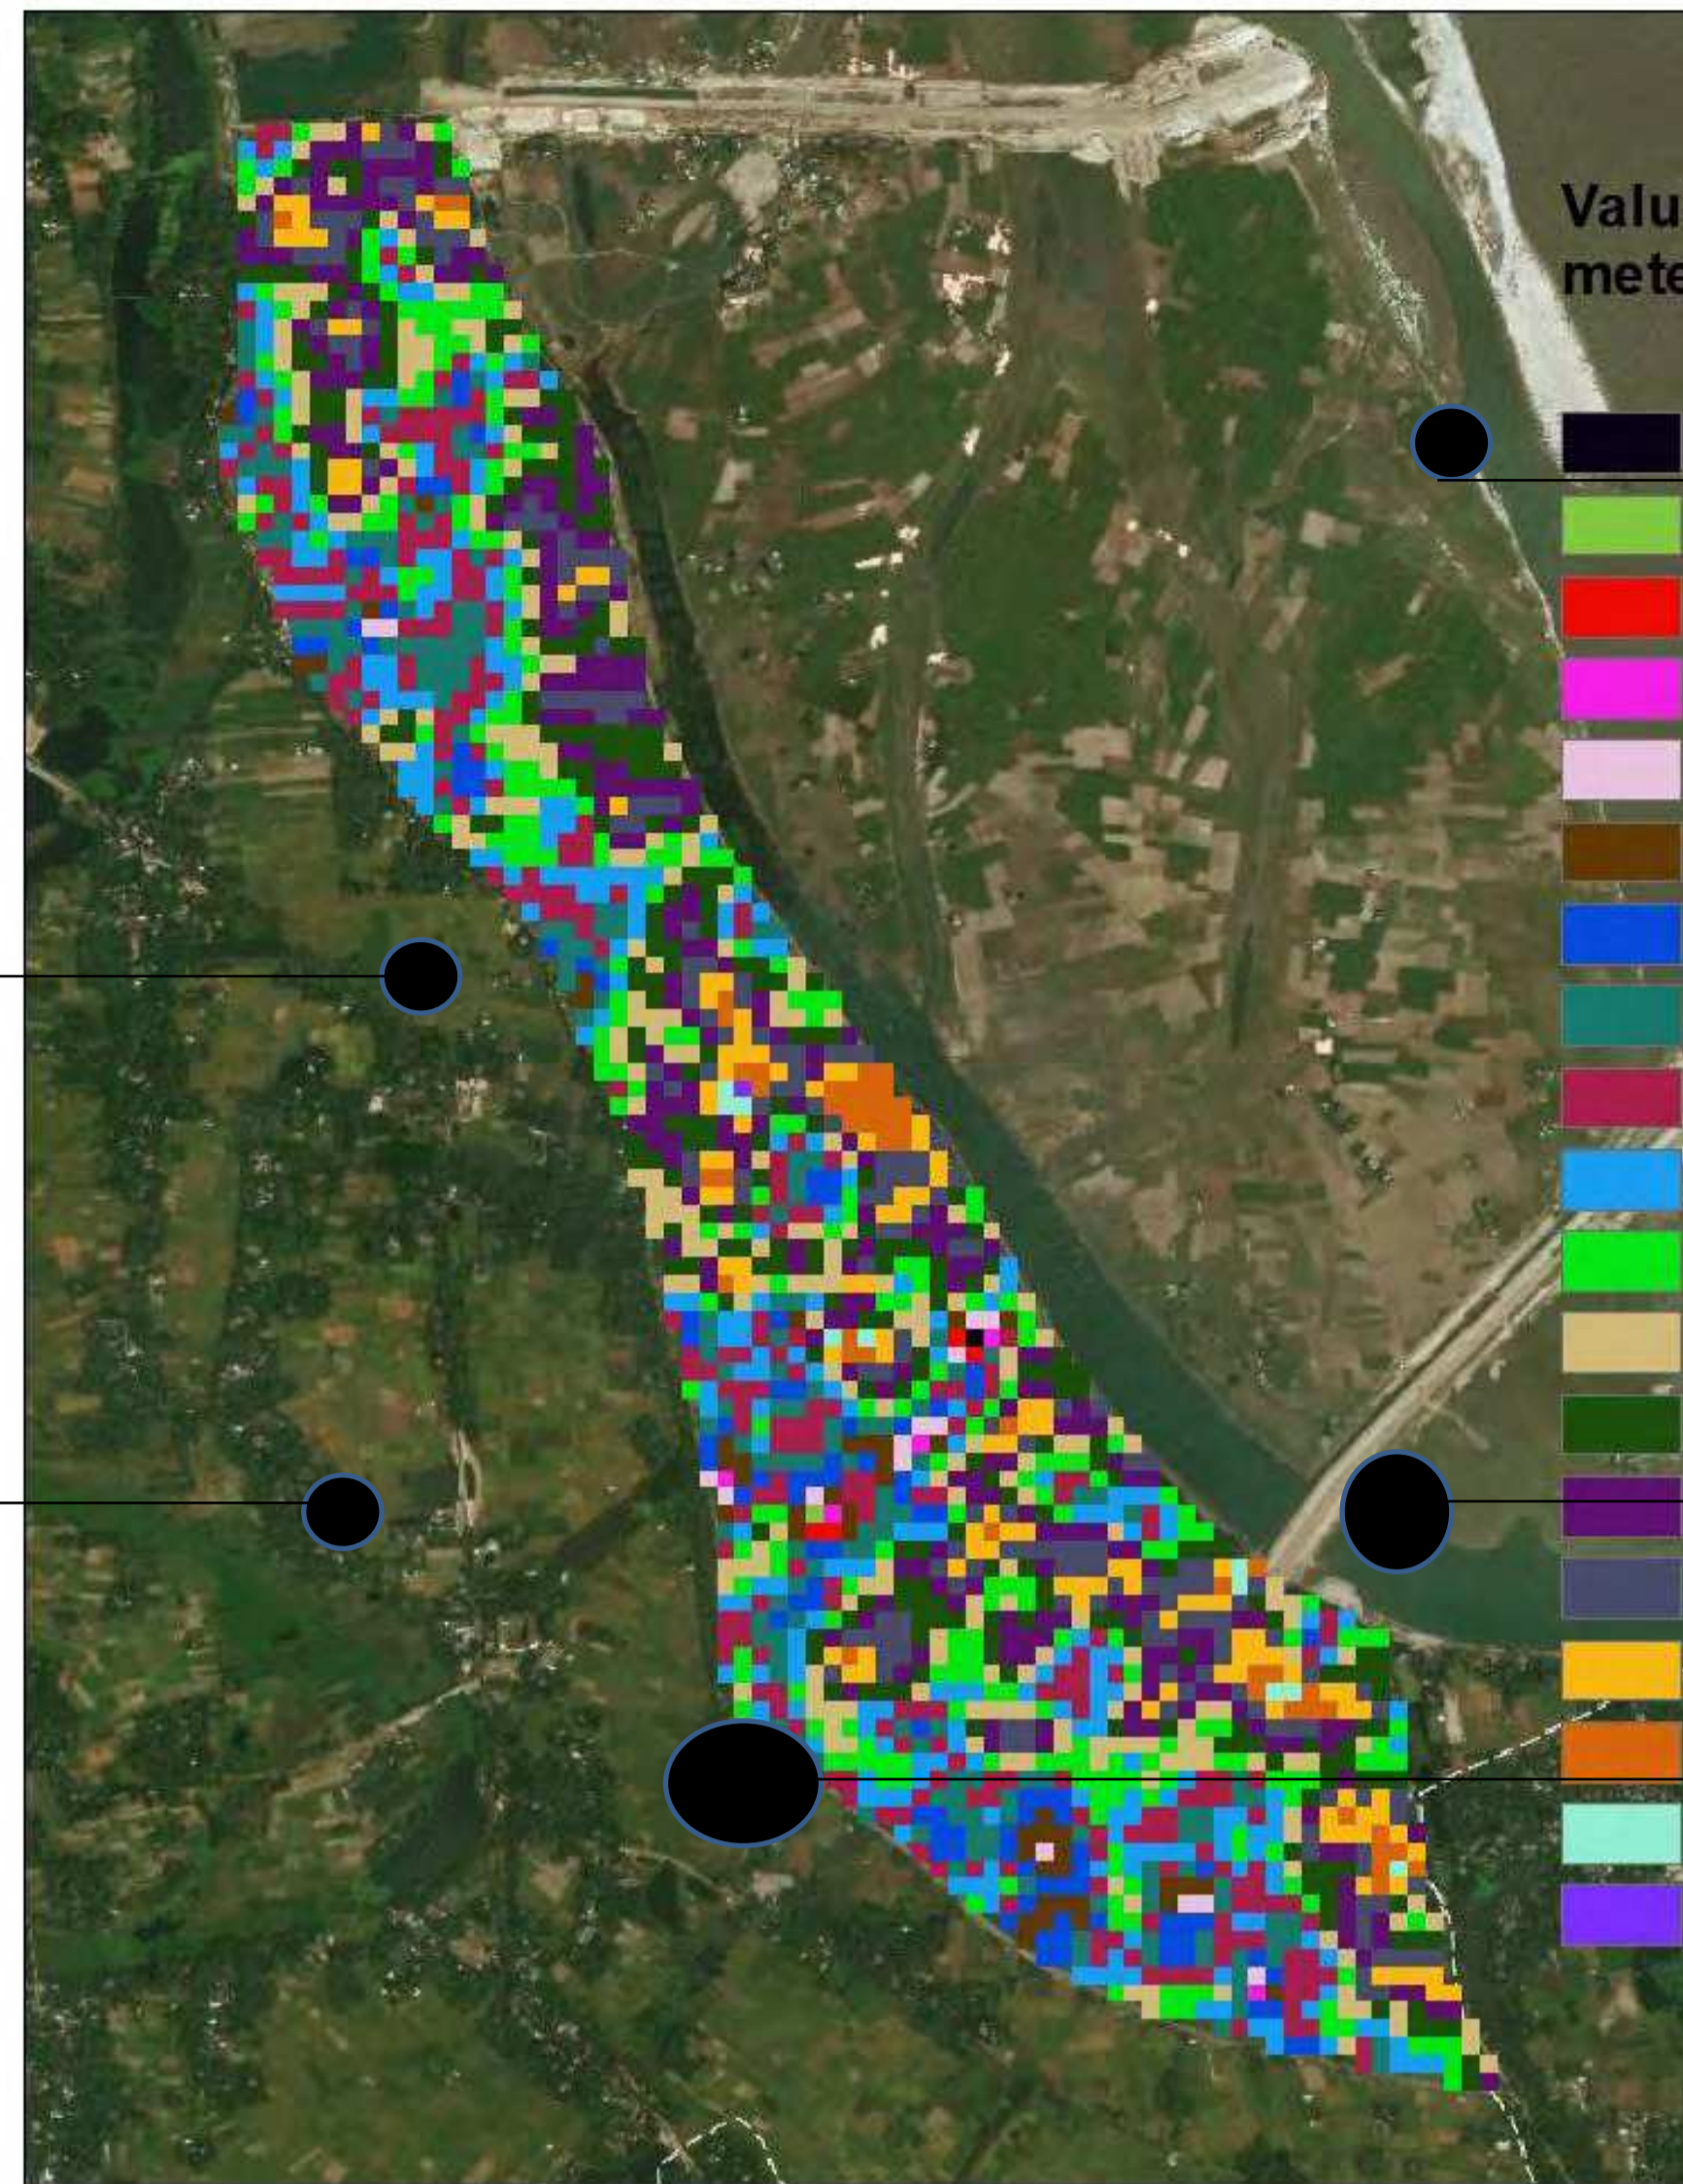

M. Rasheduzzaman (Rafi), Zahrun Zannat Surovi, Meng Hsuan Tsai, Muhammed Yusuf Jamil (Evan)

PROBLEM STATEMENT

- No Proper Forecasting System
- Local Context

Neither precise nor accurate

The presence of obstacles

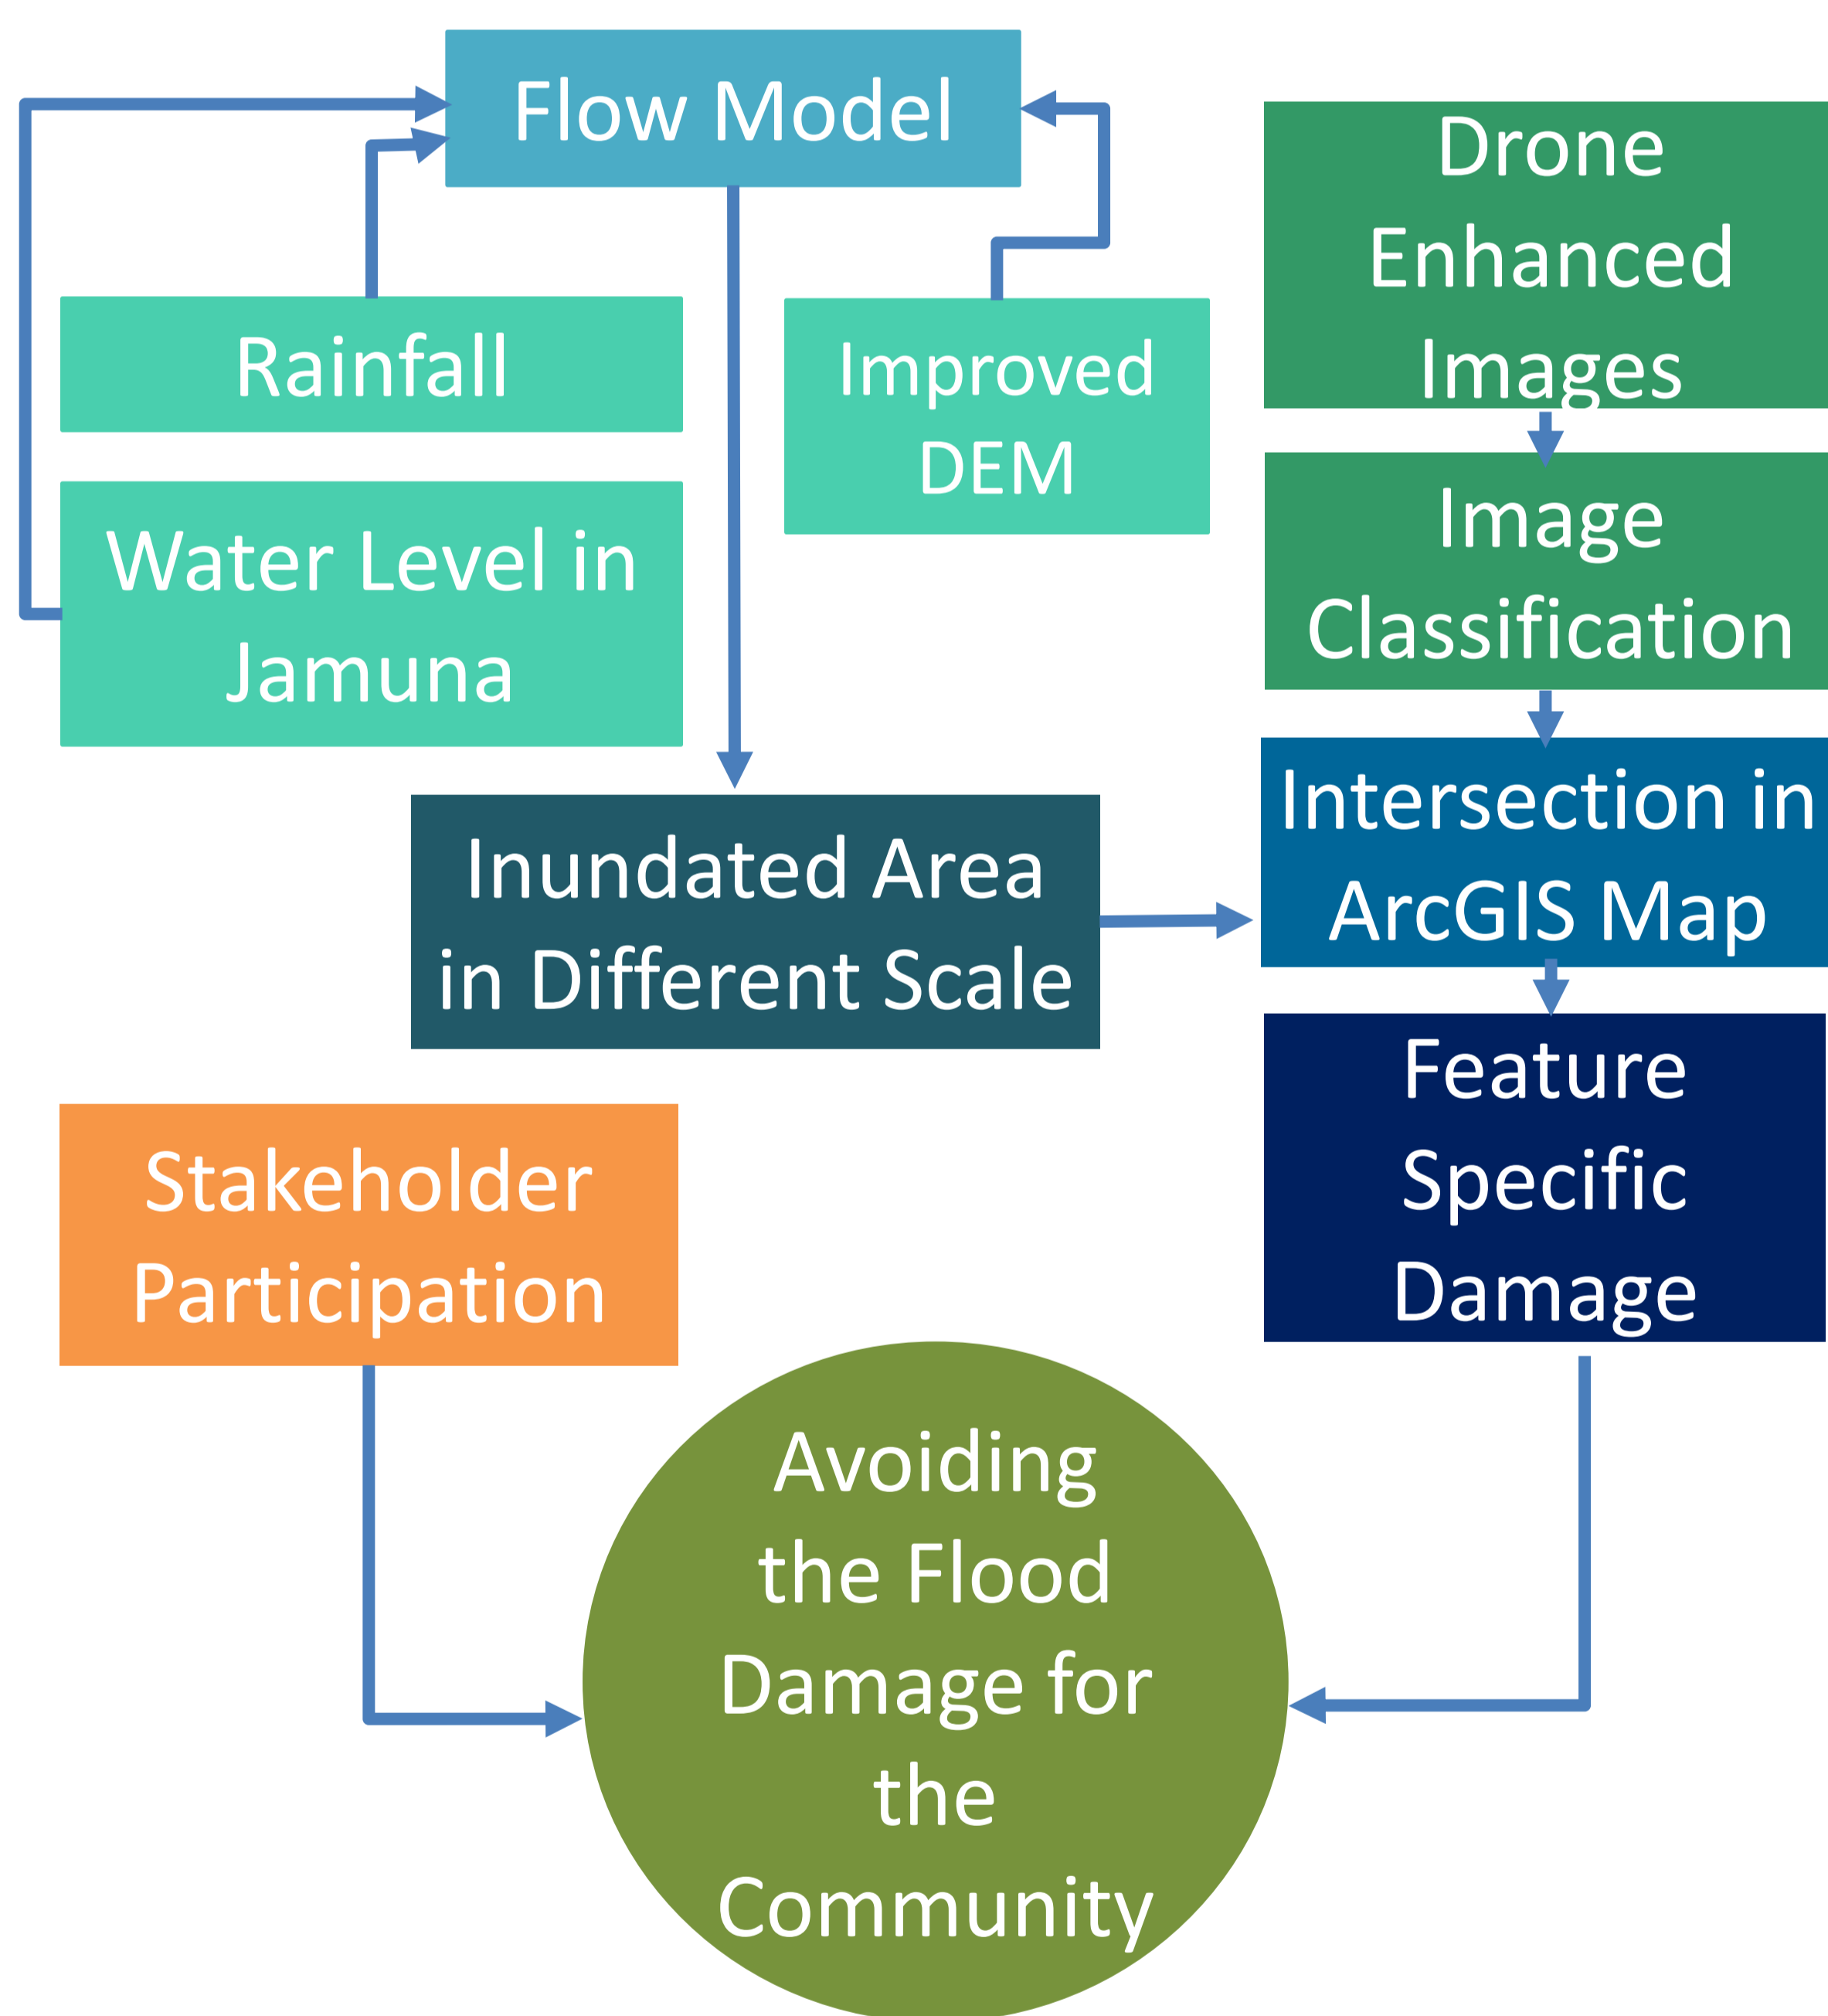

Previous DEM of the study area

Satellite Images

Without proper consideration of water control structures

Manual insertion heights

CONCEPT

Improved Digital Elevation Model

ACT TO IMPROVE

DEM GENERATION BY PHOTOGRAMMETRY

Replacing Satellite Images by

Drone Enhanced Image

Comparing two dimension of DEM

25m*25m

0.2m*0.2m

Including water control structures more precisely

Height/ Width of crossbar

Embankment

Removing obstacles from the DEM

Using CloudCompare

LOSS FOR 100 M² AREA

Structure	Loss /Structure/ month(BDT)	Number	Total (BDT)
Small Shops	26000	10	260,000
Big Shops	50000	5	250,000
Lowland Houses	12000	100	120,000
Total		115	1,710,000

BENEFITS

- Early Evacuation
- Relocation of Machine
- Moving goods of shopkeepers
- Agriculture Planning

EFFECTIVENESS

- Long-term Seasonal Flood Outlook

LIMITATIONS

- Lack of Shelters
- Lack of Income Source During Floods
